

Backend Take-Home Assignment

Overview

Role: Backend Engineer

Format: Paid take-home assignment

Expected duration: 4 hours

Build a Wallet Watchlist API - a small backend that lets users track crypto wallet addresses and inspect portfolio data. Deep blockchain knowledge is not required; mocked portfolio data is acceptable.

Repository Structure

This repository contains three branches:

- * main - general assignment overview (this document)
- * scratch - build the API from scratch; full brief included
- * boiler-plate - Express starter with TODOs and mock helpers

Getting Started

Follow these steps:

- * Read this overview
- * Choose a path and checkout the branch:

```
git checkout scratch
# or
git checkout boiler-plate
```
- * Read the README and HOME_TASK_GUIDE on your chosen branch
- * Implement the Wallet Watchlist API
- * Submit your repo plus short notes on decisions and trade-offs

What to Build

Candidates implement APIs to:

- * Manage watched wallets (CRUD + status filter)
- * Return mocked assets for a wallet
- * Return mocked activity for a wallet (with status filter)

Path Comparison

scratch: You design the architecture, stack, and folder structure yourself. Best if you want full creative control.

boiler-plate: A running Express app with route stubs, file storage scaffold, validation/error helpers, and mock portfolio data. Best if you prefer focusing on implementation over setup.

What We Evaluate

- * API design and consistency
- * Validation and error handling
- * Data modeling and persistence

- * Code organization and service boundaries
- * Basic tests (optional, if time allows)
- * README quality and example requests

Guidelines

- * Time-box to 4 hours; note any trade-offs in your submission
- * Any mainstream backend stack is fine (Node, Python, Go, etc.)
- * File DB or SQLite is sufficient for persistence
- * Do not over-engineer - a clean, working API is the goal

Submission

Include a runnable repo with setup instructions, 5-10 bullet notes on architecture decisions and assumptions, and example requests (curl, .http file, or Postman collection).

Compensation

This is a paid take-home assignment. Compensation applies whether or not we proceed to the next stage.
